FullyConnectedNets

May 4, 2018

1 Fully-Connected Neural Nets

In the previous homework you implemented a fully-connected two-layer neural network on CIFAR-10. The implementation was simple but not very modular since the loss and gradient were computed in a single monolithic function. This is manageable for a simple two-layer network, but would become impractical as we move to bigger models. Ideally we want to build networks using a more modular design so that we can implement different layer types in isolation and then snap them together into models with different architectures.

In this exercise we will implement fully-connected networks using a more modular approach. For each layer we will implement a forward and a backward function. The forward function will receive inputs, weights, and other parameters and will return both an output and a cache object storing data needed for the backward pass, like this:

```
def layer_forward(x, w):
    """ Receive inputs x and weights w """
    # Do some computations ...
    z = # ... some intermediate value
    # Do some more computations ...
    out = # the output

cache = (x, w, z, out) # Values we need to compute gradients
    return out, cache
```

The backward pass will receive upstream derivatives and the cache object, and will return gradients with respect to the inputs and weights, like this:

```
def layer_backward(dout, cache):
    """
    Receive dout (derivative of loss with respect to outputs) and cache,
    and compute derivative with respect to inputs.
    """
    # Unpack cache values
    x, w, z, out = cache

# Use values in cache to compute derivatives
    dx = # Derivative of loss with respect to x
```

```
dw = # Derivative of loss with respect to w
return dx, dw
```

After implementing a bunch of layers this way, we will be able to easily combine them to build classifiers with different architectures.

In addition to implementing fully-connected networks of arbitrary depth, we will also explore different update rules for optimization, and introduce Dropout as a regularizer and Batch/Layer Normalization as a tool to more efficiently optimize deep networks.

```
In [2]: # As usual, a bit of setup
        from __future__ import print_function
        import time
        import numpy as np
        import matplotlib.pyplot as plt
        from cs231n.classifiers.fc_net import *
        from cs231n.data_utils import get_CIFAR10_data
        from cs231n.gradient_check import eval_numerical_gradient, eval_numerical_gradient_arra
        from cs231n.solver import Solver
        %matplotlib inline
        plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
        plt.rcParams['image.interpolation'] = 'nearest'
        plt.rcParams['image.cmap'] = 'gray'
        # for auto-reloading external modules
        # see http://stackoverflow.com/questions/1907993/autoreload-of-modules-in-ipython
        %load ext autoreload
        %autoreload 2
        def rel_error(x, y):
          """ returns relative error """
          return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))))
In [3]: # Load the (preprocessed) CIFAR10 data.
        data = get_CIFAR10_data()
        for k, v in list(data.items()):
          print(('%s: ' % k, v.shape))
('X_train: ', (49000, 3, 32, 32))
('y_train: ', (49000,))
('X_val: ', (1000, 3, 32, 32))
('y_val: ', (1000,))
('X_test: ', (1000, 3, 32, 32))
('y_test: ', (1000,))
```

2 Affine layer: foward

Open the file cs231n/layers.py and implement the affine_forward function.

Once you are done you can test your implementation by running the following:

```
In [33]: # Test the affine_forward function
         num_inputs = 2
         input\_shape = (4, 5, 6)
         output_dim = 3
         input_size = num_inputs * np.prod(input_shape)
         weight_size = output_dim * np.prod(input_shape)
         x = np.linspace(-0.1, 0.5, num=input_size).reshape(num_inputs, *input_shape)
         w = np.linspace(-0.2, 0.3, num=weight_size).reshape(np.prod(input_shape), output_dim)
         b = np.linspace(-0.3, 0.1, num=output_dim)
         out, _ = affine_forward(x, w, b)
         correct_out = np.array([[ 1.49834967,  1.70660132,  1.91485297],
                                 [ 3.25553199, 3.5141327, 3.77273342]])
         # Compare your output with ours. The error should be around e-9 or less.
         print('Testing affine_forward function:')
         print('difference: ', rel_error(out, correct_out))
Testing affine_forward function:
difference: 9.769847728806635e-10
```

3 Affine layer: backward

Now implement the affine_backward function and test your implementation using numeric gradient checking.

```
# The error should be around e-10 or less
print('Testing affine_backward function:')
print('dx error: ', rel_error(dx_num, dx))
print('dw error: ', rel_error(dw_num, dw))
print('db error: ', rel_error(db_num, db))

Testing affine_backward function:
dx error: 5.399100368651805e-11
dw error: 9.904211865398145e-11
db error: 2.4122867568119087e-11
```

4 ReLU activation: forward

Implement the forward pass for the ReLU activation function in the relu_forward function and test your implementation using the following:

```
In [16]: # Test the relu forward function
        x = np.linspace(-0.5, 0.5, num=12).reshape(3, 4)
        out, _ = relu_forward(x)
                                                       0.,
        correct_out = np.array([[ 0.,
                                             0.,
                               Γ0..
                                             0.,
                                                          0.04545455, 0.13636364,],
                               [ 0.22727273, 0.31818182, 0.40909091, 0.5,
                                                                                 ]])
        # Compare your output with ours. The error should be on the order of e-8
        print('Testing relu_forward function:')
        print('difference: ', rel_error(out, correct_out))
Testing relu_forward function:
difference: 4.999999798022158e-08
```

5 ReLU activation: backward

Now implement the backward pass for the ReLU activation function in the relu_backward function and test your implementation using numeric gradient checking:

```
In [17]: np.random.seed(231)
    x = np.random.randn(10, 10)
    dout = np.random.randn(*x.shape)

    dx_num = eval_numerical_gradient_array(lambda x: relu_forward(x)[0], x, dout)
    _, cache = relu_forward(x)
```

```
dx = relu_backward(dout, cache)

# The error should be on the order of e-12
print('Testing relu_backward function:')
print('dx error: ', rel_error(dx_num, dx))

Testing relu_backward function:
dx error: 3.2756349136310288e-12
```

5.1 Inline Question 1:

We've only asked you to implement ReLU, but there are a number of different activation functions that one could use in neural networks, each with its pros and cons. In particular, an issue commonly seen with activation functions is getting zero (or close to zero) gradient flow during backpropagation. Which of the following activation functions have this problem? If you consider these functions in the one dimensional case, what types of input would lead to this behaviour? 1. Sigmoid 2. ReLU 3. Leaky ReLU

5.2 Answer:

Sigmoid has this problem, since there the range of activation is restricted to the range between 0 and 1 for all input. In the case of many layers stacked on top each other, this can produce remarkably little gradient flow.

6 "Sandwich" layers

There are some common patterns of layers that are frequently used in neural nets. For example, affine layers are frequently followed by a ReLU nonlinearity. To make these common patterns easy, we define several convenience layers in the file cs231n/layer_utils.py.

For now take a look at the affine_relu_forward and affine_relu_backward functions, and run the following to numerically gradient check the backward pass:

Relative error should be around e-10 or less

```
print('Testing affine_relu_forward and affine_relu_backward:')
    print('dx error: ', rel_error(dx_num, dx))
    print('dw error: ', rel_error(dw_num, dw))
    print('db error: ', rel_error(db_num, db))

Testing affine_relu_forward and affine_relu_backward:
dx error: 6.750562121603446e-11
dw error: 8.162015570444288e-11
db error: 7.826724021458994e-12
```

7 Loss layers: Softmax and SVM

You implemented these loss functions in the last assignment, so we'll give them to you for free here. You should still make sure you understand how they work by looking at the implementations in cs231n/layers.py.

You can make sure that the implementations are correct by running the following:

```
In [19]: np.random.seed(231)
         num_classes, num_inputs = 10, 50
         x = 0.001 * np.random.randn(num_inputs, num_classes)
         y = np.random.randint(num_classes, size=num_inputs)
         dx_num = eval_numerical_gradient(lambda x: svm_loss(x, y)[0], x, verbose=False)
         loss, dx = svm_loss(x, y)
         # Test sum_loss function. Loss should be around 9 and dx error should be around the o
         print('Testing svm_loss:')
         print('loss: ', loss)
         print('dx error: ', rel_error(dx_num, dx))
         dx_num = eval_numerical_gradient(lambda x: softmax_loss(x, y)[0], x, verbose=False)
         loss, dx = softmax_loss(x, y)
         # Test softmax_loss function. Loss should be close to 2.3 and dx error should be arou
         print('\nTesting softmax_loss:')
         print('loss: ', loss)
         print('dx error: ', rel_error(dx_num, dx))
Testing svm_loss:
loss: 8.999602749096233
dx error: 1.4021566006651672e-09
Testing softmax_loss:
loss: 2.302545844500738
dx error: 9.384673161989355e-09
```

8 Two-layer network

In the previous assignment you implemented a two-layer neural network in a single monolithic class. Now that you have implemented modular versions of the necessary layers, you will reimplement the two layer network using these modular implementations.

Open the file cs231n/classifiers/fc_net.py and complete the implementation of the TwoLayerNet class. This class will serve as a model for the other networks you will implement in this assignment, so read through it to make sure you understand the API. You can run the cell below to test your implementation.

```
In [22]: np.random.seed(231)
        N, D, H, C = 3, 5, 50, 7
        X = np.random.randn(N, D)
        y = np.random.randint(C, size=N)
         std = 1e-3
        model = TwoLayerNet(input_dim=D, hidden_dim=H, num_classes=C, weight_scale=std)
        print('Testing initialization ... ')
        W1_std = abs(model.params['W1'].std() - std)
        b1 = model.params['b1']
         W2_std = abs(model.params['W2'].std() - std)
        b2 = model.params['b2']
         assert W1_std < std / 10, 'First layer weights do not seem right'
         assert np.all(b1 == 0), 'First layer biases do not seem right'
         assert W2_std < std / 10, 'Second layer weights do not seem right'
         assert np.all(b2 == 0), 'Second layer biases do not seem right'
        print('Testing test-time forward pass ... ')
        model.params['W1'] = np.linspace(-0.7, 0.3, num=D*H).reshape(D, H)
        model.params['b1'] = np.linspace(-0.1, 0.9, num=H)
        model.params['W2'] = np.linspace(-0.3, 0.4, num=H*C).reshape(H, C)
        model.params['b2'] = np.linspace(-0.9, 0.1, num=C)
        X = np.linspace(-5.5, 4.5, num=N*D).reshape(D, N).T
         scores = model.loss(X)
         correct_scores = np.asarray(
           [[11.53165108, 12.2917344, 13.05181771, 13.81190102, 14.57198434, 15.33206765,
            [12.05769098, 12.74614105, 13.43459113, 14.1230412, 14.81149128, 15.49994135,
            [12.58373087, 13.20054771, 13.81736455, 14.43418138, 15.05099822, 15.66781506,
         scores_diff = np.abs(scores - correct_scores).sum()
         assert scores_diff < 1e-6, 'Problem with test-time forward pass'
        print('Testing training loss (no regularization)')
        y = np.asarray([0, 5, 1])
        loss, grads = model.loss(X, y)
         correct_loss = 3.4702243556
```

assert abs(loss - correct loss) < 1e-10, 'Problem with training-time loss'

```
model.reg = 1.0
         loss, grads = model.loss(X, y)
         correct_loss = 26.5948426952
         assert abs(loss - correct_loss) < 1e-10, 'Problem with regularization loss'
         # Errors should be around e-7 or less
         for reg in [0.0, 0.7]:
           print('Running numeric gradient check with reg = ', reg)
           model.reg = reg
           loss, grads = model.loss(X, y)
           for name in sorted(grads):
             f = lambda _: model.loss(X, y)[0]
             grad_num = eval_numerical_gradient(f, model.params[name], verbose=False)
             print('%s relative error: %.2e' % (name, rel_error(grad_num, grads[name])))
Testing initialization ...
Testing test-time forward pass ...
Testing training loss (no regularization)
Running numeric gradient check with reg = 0.0
W1 relative error: 1.22e-08
W2 relative error: 3.48e-10
b1 relative error: 6.55e-09
b2 relative error: 4.33e-10
Running numeric gradient check with reg = 0.7
W1 relative error: 3.12e-07
W2 relative error: 7.98e-08
b1 relative error: 1.56e-08
b2 relative error: 7.76e-10
```

9 Solver

In the previous assignment, the logic for training models was coupled to the models themselves. Following a more modular design, for this assignment we have split the logic for training models into a separate class.

Open the file cs231n/solver.py and read through it to familiarize yourself with the API. After doing so, use a Solver instance to train a TwoLayerNet that achieves at least 50% accuracy on the validation set.

```
solver.train()
       END OF YOUR CODE
       (Iteration 1 / 4900) loss: 2.304305

In [25]: # Run this cell to visualize training loss and train / val accuracy
         plt.subplot(2, 1, 1)
         plt.title('Training loss')
         plt.plot(solver.loss_history, 'o')
         plt.xlabel('Iteration')
         plt.subplot(2, 1, 2)
         plt.title('Accuracy')
         plt.plot(solver.train_acc_history, '-o', label='train')
         plt.plot(solver.val_acc_history, '-o', label='val')
         plt.plot([0.5] * len(solver.val_acc_history), 'k--')
         plt.xlabel('Epoch')
         plt.legend(loc='lower right')
         plt.gcf().set_size_inches(15, 12)
         plt.show()
```

10 Multilayer network

Next you will implement a fully-connected network with an arbitrary number of hidden layers. Read through the FullyConnectedNet class in the file cs231n/classifiers/fc_net.py.

Implement the initialization, the forward pass, and the backward pass. For the moment don't worry about implementing dropout or batch/layer normalization; we will add those features soon.

10.1 Initial loss and gradient check

As a sanity check, run the following to check the initial loss and to gradient check the network both with and without regularization. Do the initial losses seem reasonable?

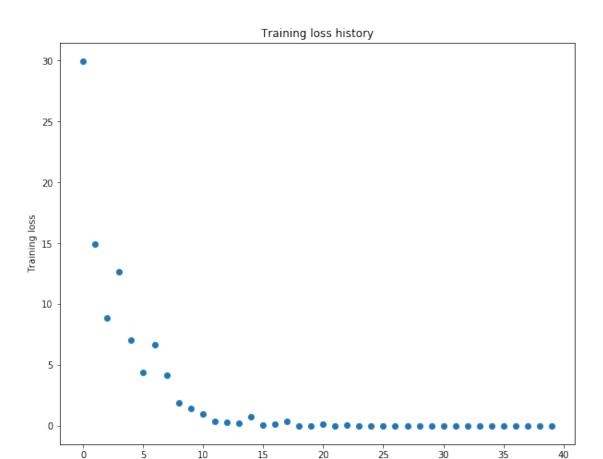

For gradient checking, you should expect to see errors around 1e-7 or less.

```
In [46]: np.random.seed(231)
    N, D, H1, H2, C = 2, 15, 20, 30, 10
    X = np.random.randn(N, D)
    y = np.random.randint(C, size=(N,))
```

```
for reg in [0, 3.14]:
             print('Running check with reg = ', reg)
             model = FullyConnectedNet([H1, H2], input_dim=D, num_classes=C,
                                       reg=reg, weight_scale=5e-2, dtype=np.float64)
             loss, grads = model.loss(X, y)
             print('Initial loss: ', loss)
           # Most of the errors should be on the order of e-7 or smaller.
           # NOTE: It is fine however to see an error for W2 on the order of e-5
           # for the check when reg = 0.0
         for name in sorted(grads):
             f = lambda _: model.loss(X, y)[0]
             grad_num = eval_numerical_gradient(f, model.params[name], verbose=False, h=1e-5)
             print('%s relative error: %.2e' % (name, rel_error(grad_num, grads[name])))
Running check with reg = 0
Initial loss: 3.4046031324121993
Running check with reg = 3.14

b2 relative error: 8.56e-09
b3 relative error: 1.07e-09
```

As another sanity check, make sure you can overfit a small dataset of 50 images. First we will try a three-layer network with 100 units in each hidden layer. In the following cell, tweak the learning rate and initialization scale to overfit and achieve 100% training accuracy within 20 epochs.

```
weight_scale=weight_scale, dtype=np.float64)
        solver = Solver(model, small_data,
                         print_every=10, num_epochs=20, batch_size=25,
                         update_rule='sgd',
                         optim config={
                           'learning_rate': learning_rate,
                         }
        solver.train()
        plt.plot(solver.loss_history, 'o')
        plt.title('Training loss history')
        plt.xlabel('Iteration')
        plt.ylabel('Training loss')
        plt.show()
(Iteration 1 / 40) loss: 29.977639
(Epoch 0 / 20) train acc: 0.160000; val_acc: 0.047000
(Epoch 1 / 20) train acc: 0.220000; val_acc: 0.056000
(Epoch 2 / 20) train acc: 0.400000; val_acc: 0.068000
(Epoch 3 / 20) train acc: 0.340000; val acc: 0.107000
(Epoch 4 / 20) train acc: 0.680000; val_acc: 0.105000
(Epoch 5 / 20) train acc: 0.780000; val acc: 0.108000
(Iteration 11 / 40) loss: 0.971397
(Epoch 6 / 20) train acc: 0.880000; val acc: 0.117000
(Epoch 7 / 20) train acc: 0.940000; val_acc: 0.116000
(Epoch 8 / 20) train acc: 0.960000; val acc: 0.109000
(Epoch 9 / 20) train acc: 0.980000; val_acc: 0.102000
(Epoch 10 / 20) train acc: 0.980000; val_acc: 0.103000
(Iteration 21 / 40) loss: 0.130552
(Epoch 11 / 20) train acc: 1.000000; val_acc: 0.102000
(Epoch 12 / 20) train acc: 1.000000; val_acc: 0.110000
(Epoch 13 / 20) train acc: 1.000000; val_acc: 0.106000
(Epoch 14 / 20) train acc: 1.000000; val_acc: 0.104000
(Epoch 15 / 20) train acc: 1.000000; val_acc: 0.103000
(Iteration 31 / 40) loss: 0.005030
(Epoch 16 / 20) train acc: 1.000000; val_acc: 0.104000
(Epoch 17 / 20) train acc: 1.000000; val acc: 0.104000
(Epoch 18 / 20) train acc: 1.000000; val_acc: 0.104000
(Epoch 19 / 20) train acc: 1.000000; val acc: 0.106000
(Epoch 20 / 20) train acc: 1.000000; val_acc: 0.108000
```

Now try to use a five-layer network with 100 units on each layer to overfit 50 training examples. Again you will have to adjust the learning rate and weight initialization, but you should be able to achieve 100% training accuracy within 20 epochs.

Iteration

10.2 Inline Question 2:

Did you notice anything about the comparative difficulty of training the three-layer net vs training the five layer net? In particular, based on your experience, which network seemed more sensitive to the initialization scale? Why do you think that is the case?

10.3 Answer:

The 5-layer net was more sensitive to initialization scale than the 3-layer net. This made tuning the 5-layer net more difficult. I think this is the case because more layers allows more susceptibility to exploding/disappearing gradients, due to a magnification of initial conditions occurring at every layer.

11 Update rules

So far we have used vanilla stochastic gradient descent (SGD) as our update rule. More sophisticated update rules can make it easier to train deep networks. We will implement a few of the most commonly used update rules and compare them to vanilla SGD.

12 SGD+Momentum

Stochastic gradient descent with momentum is a widely used update rule that tends to make deep networks converge faster than vanilla stochastic gradient descent. See the Momentum Update section at http://cs231n.github.io/neural-networks-3/#sgd for more information.

Open the file cs231n/optim.py and read the documentation at the top of the file to make sure you understand the API. Implement the SGD+momentum update rule in the function sgd_momentum and run the following to check your implementation. You should see errors less than e-8.

```
In [65]: from cs231n.optim import sgd momentum
        N, D = 4, 5
        w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
        dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
        v = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
        config = {'learning_rate': 1e-3, 'velocity': v}
        next_w, _ = sgd_momentum(w, dw, config=config)
        expected_next_w = np.asarray([
          [0.1406,
                     0.20738947, 0.27417895, 0.34096842, 0.40775789],
          [ 0.47454737, 0.54133684, 0.60812632, 0.67491579, 0.74170526],
           [ 0.80849474, 0.87528421, 0.94207368, 1.00886316, 1.07565263],
           [ 1.14244211, 1.20923158, 1.27602105, 1.34281053, 1.4096
                                                                         ]])
        expected velocity = np.asarray([
          [0.5406,
                     0.55475789, 0.56891579, 0.58307368, 0.59723158],
           [0.61138947, 0.62554737, 0.63970526, 0.65386316, 0.66802105],
           [0.68217895, 0.69633684, 0.71049474, 0.72465263, 0.73881053],
          [ 0.75296842, 0.76712632, 0.78128421, 0.79544211, 0.8096
                                                                         ]])
        # Should see relative errors around e-8 or less
        print('next_w error: ', rel_error(next_w, expected_next_w))
        print('velocity error: ', rel_error(expected_velocity, config['velocity']))
next w error: 8.882347033505819e-09
velocity error: 4.269287743278663e-09
```

Once you have done so, run the following to train a six-layer network with both SGD and SGD+momentum. You should see the SGD+momentum update rule converge faster.

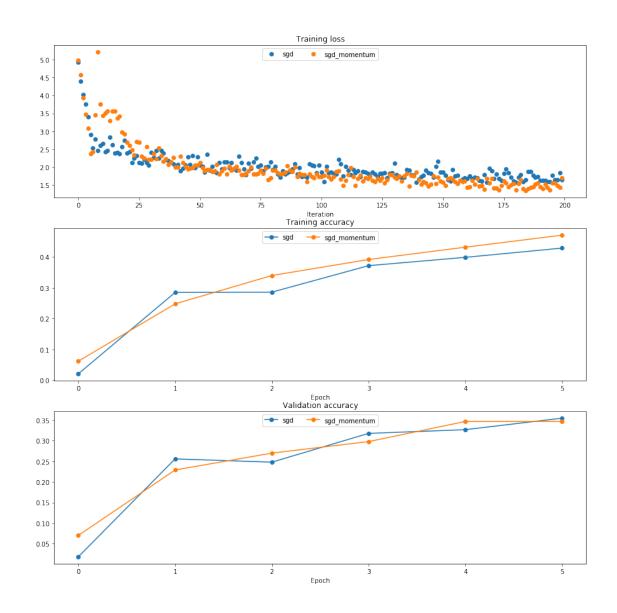

```
for update_rule in ['sgd', 'sgd_momentum']:
           print('running with ', update_rule)
           model = FullyConnectedNet([100, 100, 100, 100, 100], weight_scale=5e-2)
           solver = Solver(model, small_data,
                           num_epochs=5, batch_size=100,
                           update_rule=update_rule,
                           optim_config={
                             'learning_rate': 1e-2,
                           },
                           verbose=True)
           solvers[update_rule] = solver
           solver.train()
           print()
         plt.subplot(3, 1, 1)
         plt.title('Training loss')
         plt.xlabel('Iteration')
         plt.subplot(3, 1, 2)
         plt.title('Training accuracy')
         plt.xlabel('Epoch')
         plt.subplot(3, 1, 3)
         plt.title('Validation accuracy')
         plt.xlabel('Epoch')
         for update_rule, solver in list(solvers.items()):
           plt.subplot(3, 1, 1)
           plt.plot(solver.loss_history, 'o', label=update_rule)
           plt.subplot(3, 1, 2)
           plt.plot(solver.train_acc_history, '-o', label=update_rule)
           plt.subplot(3, 1, 3)
           plt.plot(solver.val_acc_history, '-o', label=update_rule)
         for i in [1, 2, 3]:
           plt.subplot(3, 1, i)
           plt.legend(loc='upper center', ncol=4)
         plt.gcf().set_size_inches(15, 15)
         plt.show()

13 RMSProp and Adam

RMSProp [1] and Adam [2] are update rules that set per-parameter learning rates by using a running average of the second moments of gradients.

In the file cs231n/optim.py, implement the RMSProp update rule in the rmsprop function and implement the Adam update rule in the adam function, and check your implementations using the tests below.

NOTE: Please implement the *complete* Adam update rule (with the bias correction mechanism), not the first simplified version mentioned in the course notes.

- [1] Tijmen Tieleman and Geoffrey Hinton. "Lecture 6.5-rmsprop: Divide the gradient by a running average of its recent magnitude." COURSERA: Neural Networks for Machine Learning 4 (2012).
- [2] Diederik Kingma and Jimmy Ba, "Adam: A Method for Stochastic Optimization", ICLR 2015.

```
In [73]: # Test RMSProp implementation
        from cs231n.optim import rmsprop
        N, D = 4, 5
        w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
        dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
        cache = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
        config = {'learning_rate': 1e-2, 'cache': cache}
        next_w, _ = rmsprop(w, dw, config=config)

Once you have debugged your RMSProp and Adam implementations, run the following to train a pair of deep networks using these new update rules:

```
verbose=True)
           solvers[update_rule] = solver
           solver.train()
           print()
         plt.subplot(3, 1, 1)
         plt.title('Training loss')
         plt.xlabel('Iteration')
         plt.subplot(3, 1, 2)
         plt.title('Training accuracy')
         plt.xlabel('Epoch')
         plt.subplot(3, 1, 3)
         plt.title('Validation accuracy')
         plt.xlabel('Epoch')
         for update_rule, solver in list(solvers.items()):
           plt.subplot(3, 1, 1)
           plt.plot(solver.loss_history, 'o', label=update_rule)
           plt.subplot(3, 1, 2)
           plt.plot(solver.train_acc_history, '-o', label=update_rule)
           plt.subplot(3, 1, 3)
           plt.plot(solver.val_acc_history, '-o', label=update_rule)
         for i in [1, 2, 3]:
           plt.subplot(3, 1, i)
           plt.legend(loc='upper center', ncol=4)
         plt.gcf().set_size_inches(15, 15)
         plt.show()

13.1 Inline Question 3:

AdaGrad, like Adam, is a per-parameter optimization method that uses the following update rule:

```
cache += dw**2
w += - learning_rate * dw / (np.sqrt(cache) + eps)
```

John notices that when he was training a network with AdaGrad that the updates became very small, and that his network was learning slowly. Using your knowledge of the AdaGrad update rule, why do you think the updates would become very small? Would Adam have the same issue?

13.2 Answer:

AdaGrad is likely overestimating the update direction of every parameter, therefore overshooting its update each time. Adam would not have this problem because it counters AdaGrad with

14 Train a good model!

Train the best fully-connected model that you can on CIFAR-10, storing your best model in the best_model variable. We require you to get at least 50% accuracy on the validation set using a fully-connected net.

If you are careful it should be possible to get accuracies above 55%, but we don't require it for this part and won't assign extra credit for doing so. Later in the assignment we will ask you to train the best convolutional network that you can on CIFAR-10, and we would prefer that you spend your effort working on convolutional nets rather than fully-connected nets.

You might find it useful to complete the BatchNormalization.ipynb and Dropout.ipynb note-books before completing this part, since those techniques can help you train powerful models.

```
In [150]: best_model = None
       # TODO: Train the best FullyConnectedNet that you can on CIFAR-10. You might
       # find batch/layer normalization and dropout useful. Store your best model in
       # the best model variable.
       X_val = data['X_val']
      y_val = data['y_val']
      X_test = data['X_test']
